Changing Wealth of Nations 2021

The World Bank's wealth accounts capture the value of assets in a country that generate income and support human well-being. Wealth accounts—including produced, human and natural capital—are useful complements to other economic indicators, such as GDP. The accounts provide a measure of capital stocks or the balance sheet of a nation, including assets not traditionally included in national accounts. Furthermore, disaggregated accounts show how countries are balancing their portfolio of assets, including whether GDP growth is accompanied by asset accumulation or depletion, and show the degree of asset diversification in a country. These economic indicators, therefore, can provide guidance for managing economies more sustainably over time, and allow for cross-country comparisons on economic performance and sustainable development.

Note: this is an automated country profile that presents an overview of the most recent wealth estimates for **Czech Republic** as part of the Changing Wealth of Nations 2021: Managing Assets for the Future report (CWON 2021). CWON 2021 data uses readily available global datasets and may deviate from the actual country data. To access the full report, methodology, and database please visit www.worldbank.org/cwon.

Overview of wealth

The sum of the stock of total wealth, comprising produced capital, renewable and nonrenewable natural capital, human capital, and net foreign assets in **Czech Republic** reached **2,933** billion US dollars in 2018. Between 1995 and 2018 **Czech Republic's** GDP has increased by **81** percent, while its total wealth has increased by **51** percent during the same years. Figure 1 shows **Czech Republic's** total wealth by year compared to annual GDP between 1995 and 2018.

The change in wealth per capita is a leading measure of long-term sustainability. Declining wealth per capita could indicate insufficient investment in a nation's assets, or that they are being mismanaged or misvalued. In 1995, **Czech Republic's** total wealth per capita was **188** thousand US dollars and in 2018 it reached **276** thousand US dollars, a change of **47** percent. Figure 2 shows **Czech Republic's** total wealth per capita compared to its region and income group.

Composition of total wealth

In addition to measuring the change in wealth per capita, quantifying contributions from individual wealth components allow policy makers to monitor the sustainability of development and its resilience to shocks. **Czech Republic's** wealth is composed of natural capital, human capital, produced capital and net foreign assets. Globally, natural capital comprises renewable assets—such as forests, mangroves, fisheries, and land—and nonrenewable assets, including fossil fuels, metals, and minerals. In 2018 **Czech Republic's** natural capital per capita reached 6 thousand US dollars, about 2.2 percent of its total wealth per capita.

Figure 3. Wealth per capita composition

Human capital estimates the value of the expected future labor income that could be generated over the lifetime of the current working population. This is disaggregated by gender and employment status (employed and self-employed). In 2018 **Czech Republic's** human capital per capita was worth 145 thousand US dollars, which represents 52.5 percent of its total wealth per capita.

Produced capital measures the sum of investment minus normal depreciation, including assets such as machinery, buildings, equipment, intangible wealth such as intellectual property and mineral exploration, and residential and nonresidential urban land. In 2018 **Czech Republic's** produced capital per capita reached a total of 130 thousand US dollars, a 47.2 percent of **Czech Republic's** total wealth per capita.

Net foreign assets are the sum of a country's external assets and liabilities: for example, foreign direct investment and reserve assets. Net foreign assets can be positive or negative. When these are negative, they are subtracted from total wealth. In 2018 **Czech Republic's** net foreign assets per capita reached -5 thousand US dollars, 1.9 percent the size of the country's total wealth per capita.

Figure 3 shows annual composition of **Czech Republic's** wealth per person between 1995 and 2018 distinguishing between net foreign assets, produced capital, human capital, and renewable and nonrenewable natural capital.

A diverse asset portfolio is more resilient than one overly dependent on a single asset. Countries can choose to invest in different wealth components and achieve a more balanced and resilient asset portfolio. Analyzing the evolution of the main wealth components, policy makers can have better tools to build and manage a comprehensive wealth portfolio and decide what mix of assets would help them achieve this goal. Figure 4 shows the evolution of **Czech Republic's** total produced, human and natural capital between 1995 and 2018. Figure 5 shows these same wealth components divided by the country's total population.

Figure 5. Produced, human, and natural capital per capita

Natural capital

Natural capital is a vital part of **Czech Republic's** total wealth and is linked to natural resources. Environmentally harmful fossil fuels are often overrewarded by markets, while essential renewable natural assets are often undervalued and underpriced. Declining stocks of renewable natural capital, for example, may reflect overexploitation or degradation of these assets. Likewise, declining stocks of nonrenewable natural capital, could indicate decreasing value or increasing depletion of these natural resources. The analysis of such assets can help us identify when natural resources are mismanaged or help guide more sustainable policies. Figure 6 compares **Czech Republic's** total renewable and nonrenewable natural capital, while figure 7 shows the value of these assets divided by the country's population between 1995 and 2018.

Figure 6. Renewable vs nonrenewable natural capital

Figure 7. Renewable vs nonrenewable natural capital per capita

The composition of renewable and nonrenewable natural capital can also fluctuate. Increasing overreliance on one asset could increase the country's macroeconomic and fiscal risk, especially if these are commodities. Figure 8 shows **Czech Republic's** composition of total renewable natural capital, while figure 9 shows the share of each asset in total renewable natural capital. Likewise, figure 10 shows the composition of **Czech Republic's** total nonrenewable natural capital over time and figure 11 shows the share of each asset in total nonrenewable natural capital between 1995 and 2018.

Figure 8. Renewable natural capital composition

Figure 9. Renewable natural capital component share

Figure 10. Nonrenewable natural capital composition

Figure 11. Nonrenewable natural capital component share

Human capital

Human capital, measured by the present value of estimated earnings over a person's lifetime, is the most important component of wealth globally. This edition provides wealth accounts for human capital disaggregated by gender and employment status. Analyzing CWON 2021 human capital can provide information on disparities between male and female, and between employed and self-employed human capital. Figure 12 compares **Czech Republic's** composition of total human capital per capita in 1995 and 2018, while figure 13 compares these components share in **Czech Republic's** total human capital per capita.
